with the DSP **1205** and can access an optionally incorporated SIM card **1249** and a memory **1251**. In addition, the MCU **1203** executes various control functions required of the terminal. The DSP **1205** may, depending upon the implementation, perform any of a variety of conventional digital processing functions on the voice signals. Additionally, DSP **1205** determines the background noise level of the local environment from the signals detected by microphone **1211** and sets the gain of microphone **1211** to a level selected to compensate for the natural tendency of the user of the mobile terminal **1201**.

[0088] The CODEC **1213** includes the ADC **1223** and DAC **1243**. The memory **1251** stores various data including call incoming tone data and is capable of storing other data including music data received via, e.g., the global Internet. The software module could reside in RAM memory, flash memory, registers, or any other form of writable storage medium known in the art. The memory device **1251** may be, but not limited to, a single memory, CD, DVD, ROM, RAM, EEPROM, optical storage, or any other non-volatile storage medium capable of storing digital data.

[0089] An optionally incorporated SIM card **1249** carries, for instance, important information, such as the cellular phone number, the carrier supplying service, subscription details, and security information. The SIM card **1249** serves primarily to identify the mobile terminal **1201** on a radio network. The card **1249** also contains a memory for storing a personal telephone number registry, text messages, and user specific mobile terminal settings.

[0090] While the invention has been described in connection with a number of embodiments and implementations, the invention is not so limited but covers various obvious modifications and equivalent arrangements, which fall within the purview of the appended claims. Although features of the invention are expressed in certain combinations among the claims, it is contemplated that these features can be arranged in any combination and order.

1.-33. (canceled)

34. A method comprising facilitating a processing of and/or processing (1) data and/or (2) information and/or (3) at least one signal, the (1) data and/or (2) information and/or (3) at least one signal based, at least in part, on the following:

a presentation of a messaging user interface associated with one or more messaging services at a device; and

a presentation of a user interface element providing a link to one or more communications sessions corresponding to the one or more messaging services,

wherein a selection of the user interface element causes, at least in part, a presentation of one or more representations of the one or more communications sessions as one or more overlay elements on the messaging user interface.

35. A method of claim **34**, wherein the (1) data and/or (2) information and/or (3) at least one signal are further based, at least in part, on the following:

a message corresponding to one of the one or more communications sessions; and

a highlighting of the user interface element based, at least in part, on a reception of the message.

36. A method of claim **34**, wherein the (1) data and/or (2) information and/or (3) at least one signal are further based, at least in part, on the following:

a touch enabled input for selecting the user interface element;

a presentation of the one or more representations as the one or more overlay elements on the messaging user interface based, at least in part, on the touch enabled input;

another touch enabled input for selecting one of the one or more overlay elements; and

a presentation of one of the one or more communications sessions corresponding to the selected one of the one or more overlay elements.

37. A method of claim **36**, wherein the selected one of the one or more overlay elements is highlighted.

38. A method of claim **34**, wherein the (1) data and/or (2) information and/or (3) at least one signal are further based, at least in part, on the following:

a message corresponding to one of the one or more communications sessions,

wherein the presentation of the messaging user interface is focused on one of the one or more messaging services;

at least one determination that the message is associated with another one of the one or more messaging services; and

a presentation of another user interface element providing a link to the another one of the one or more messaging services, wherein the other user interface element includes, at least in part, an obscured visual indicator associated with the another one of the one or more messaging services.

39. A method of claim **38**, wherein the (1) data and/or (2) information and/or (3) at least one signal are further based, at least in part, on the following:

a touch enabled input for selecting the another user interface element; and

a presentation of another messaging interface associated with the another one of the one or more messaging services based, at least in part, on the touch enabled input.

40. A method of claim **34**, wherein the (1) data and/or (2) information and/or (3) at least one signal are further based, at least in part, on the following:

a message corresponding to one of the one or more communications sessions,

wherein the user interface element further presents a preview of the message.

41. A method of claim **40**, wherein the preview is presented corresponding to an animation of the user interface element sliding out from a portion of the messaging user interface, and wherein the preview is removed from presentation based, at least in part, on a predetermined time period.

42. An apparatus comprising:

at least one processor; and

at least one memory including computer program code for one or more programs,

the at least one memory and the computer program code configured to, with the at least one processor, cause the apparatus to perform at least the following,

cause, at least in part, a presentation of a messaging user interface associated with one or more messaging services at a device;

cause, at least in part, a presentation of a user interface element providing a link to one or more communications sessions corresponding to the one or more messaging services,

wherein a selection of the user interface element causes, at least in part, a presentation of one or more repre-
